

Program Structures and Algorithms  
Spring 2023(SEC – 1)

NAME: Foram Kamani

NUID: 002732551

**Task:**

Step 1: (a) Implement height-weighted Quick Union with Path Compression. For this, you will flesh out the class UF\_HWQUPC. All you have to do is to fill in the sections marked with // TO BE IMPLEMENTED ... // ...END IMPLEMENTATION.

(b) Check that the unit tests for this class all work. You must show "green" test results in your submission (the screenshot is OK).

Step 2:

Using your implementation of UF\_HWQUPC, develop a UF ("union-find") client that takes an integer value  $n$  from the command line to determine the number of "sites." Then generates random pairs of integers between 0 and  $n-1$ , calling `connected()` to determine if they are connected and `union()` if not. Loop until all sites are connected then print the number of connections generated. Package your program as a static method `count()` that takes  $n$  as the argument and returns the number of connections; and a `main()` that takes  $n$  from the command line, calls `count()`, and prints the returned value. If you prefer, you can create a main program that doesn't require any input and runs the experiment for a fixed set of  $n$  values. Show evidence of your run(s).

Step 3:

Determine the relationship between the number of objects ( $n$ ) and the number of pairs ( $m$ ) generated to accomplish this (i.e. to reduce the number of components from  $n$  to 1). Justify your conclusion in terms of your observations and what you think might be going on.

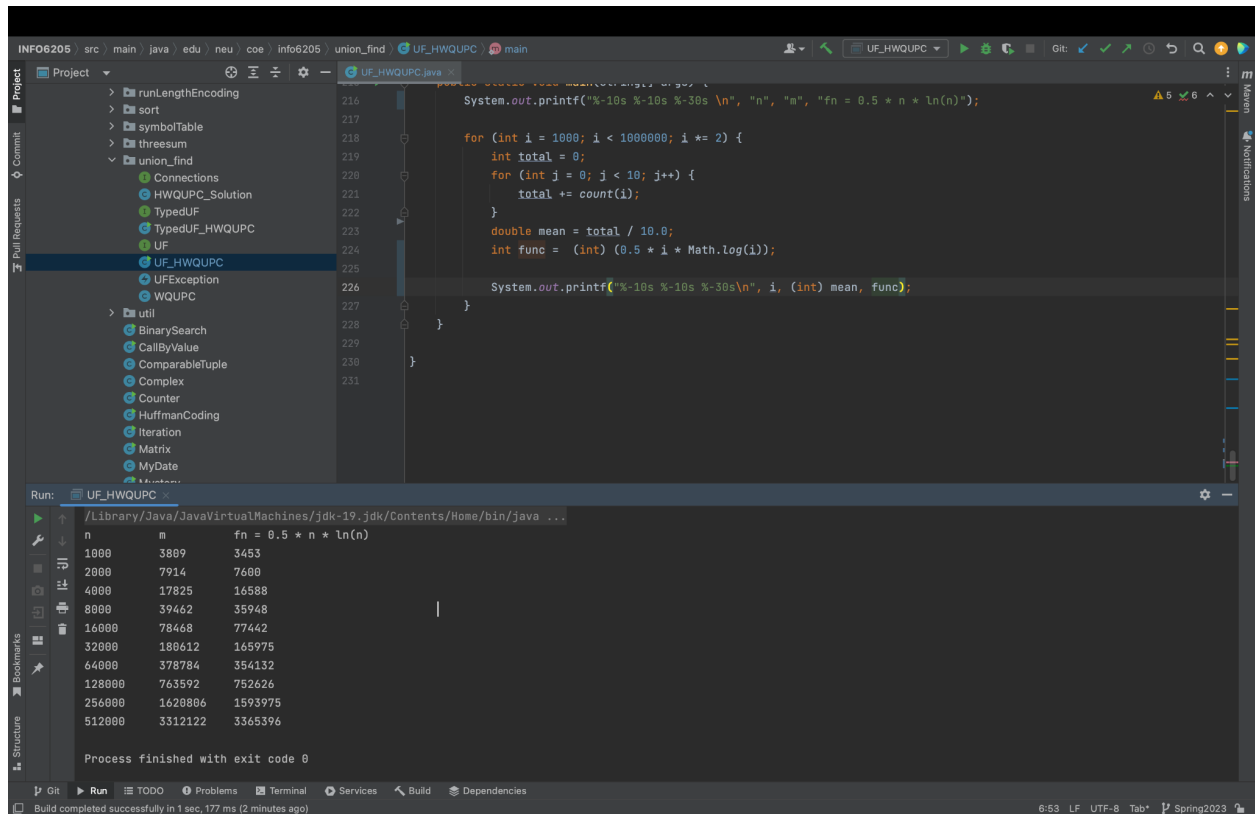

**Relationship Conclusion:**

After executing the main method with multiple values of  $n$ , I have concluded that the relationship between the number of objects( $n$ ) and the number of pairs( $m$ ) generated is nearly equal to  $m=n(\ln(n))/2$

$$m = f(n) = 0.5 * n * \ln(n)$$

## Evidence to support that conclusion:

1. Values of  $n$  are ranging from 1000 to 512000(doubling each time).
2. For each value of  $n$ , the program is running 100 times, and the average value of  $m$  is shown below.

The screenshot shows an IDE with a Java project named 'UF\_HWQUPC'. The code in 'UF\_HWQUPC.java' is as follows:

```
216 System.out.printf("%-10s %-10s %-30s\n", "n", "m", "fn = 0.5 * n * ln(n)");
217
218 for (int i = 1000; i < 1000000; i *= 2) {
219     int total = 0;
220     for (int j = 0; j < 10; j++) {
221         total += count(i);
222     }
223     double mean = total / 10.0;
224     int func = (int) (0.5 * i * Math.log(i));
225
226     System.out.printf("%-10s %-10s %-30s\n", i, (int) mean, func);
227 }
228
229 }
230
231 }
```

The Run window shows the output of the program:

n	m	fn = 0.5 * n * ln(n)
1000	3809	3453
2000	7914	7600
4000	17825	16588
8000	39462	35948
16000	78468	77442
32000	180612	165975
64000	378784	354132
128000	763592	752626
256000	1620806	1593975
512000	3312122	3365396

Process finished with exit code 0
